

## BREEDING PACK

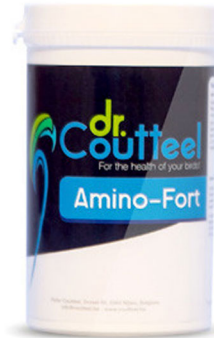

During reproduction, the couples eat egg paste to cover their high energetic needs and to be able to raise the young birds

However, during this period they need several nutritional supplements to cover all their needs.

To do this, we will work with 2 products:

**Vit-Az-Min**, which supplies amino acids, minerals, trace elements and mainly calcium. These favor a smooth, regular setting and provide a solid and even egg shell.

**Amino-Fort**, which provides the essential amino acids, which are essential for the growth of young birds. It replaces other sources of protein and promotes the rapid growth of young birds. Young birds grow quickly by developing good muscle mass.

The scheme to follow is very simple:

These two products will be administered 4 times a week, mixed in the food.

**Vit-Az-Min**      **20 gr per kg of food**

**Amino-Fort**      **20-30 gr per kg of food**

With this simple method we will ensure that the breeders will be in full power to obtain a quality young birds.
