

# Treatment scheme against Mites in Pigeons

## SYMPTOM:

- They are hardly perceived by the human eye, due to its small size.
- They cause lesions in the feathers, hence they are also called "eaters of feathers".
- The pigeons with this ailment are nervous, they are scratching continuously, both with the beak as with the legs.
- Bald patches appear on the plumage, especially in the crop area, reaching some occasions to appear skin lesions.

## Necessary products:

**MOXIDECTINE:** for the treatment and prevention against mites housed in the feathers or other external parasites.

**NEW AMBUSH:** improved formula for the elimination of mites and other external parasites through bath water.

## Scheme to follow for the elimination of Mites in the feathers
